

Anmatak

A personalised Arabic health-coaching bot, powered by WHOOP data.

App Name	Anmatak
Developer	Independent solo developer — Saudi Arabia
Contact	anmatak.coach@gmail.com
Privacy Policy	https://anmatak-coach.github.io/anmatak-privacy/privacy.html
Platform	Telegram bot (Arabic-language)
Beta users	2 active WHOOP members (47 days live)
Submission	June 2026

1 · What is Anmatak?

Anmatak (meaning *Your Patterns* in Arabic) is a Telegram-based personal health-coaching bot designed for Arabic-speaking WHOOP members. It delivers daily, weekly, and monthly health insights entirely in Khaleeji (Gulf) Arabic dialect — a language and cultural context that WHOOP's own platform does not address.

WHOOP provides the physiological data. Anmatak provides the personalised Arabic narrative. The bot cross-references WHOOP metrics with the user's own self-reported data (energy, stress, caffeine timing, meals, workouts) to build a coaching layer that is specific to each individual.

Core principle: Anmatak is built on **scientific honesty**. It never fabricates a pattern from sparse data, never reassures the user without statistical confidence, and always distinguishes between an observation and a confirmed pattern. The 4-gate insight engine (data sufficiency → signal → confidence → no-reassurance) ensures every message is defensible.

2 · How WHOOP Data Is Used

WHOOP metric	How Anmatak uses it
Recovery score	Daily readiness summary; cumulative 3-day trend vs 30-day baseline
Sleep (duration + deep)	Nightly sleep report; adequacy classification; weekly trend
HRV (rmssd)	Body-flexibility metric; directional trend with cause attribution
Resting heart rate	Cardiovascular trend; contextual insight
Strain score	Effort-vs-recovery balance; weekly workout summary
Activity / cycles	Weekly pulse: workout count, late-caffeine days

All WHOOP data is accessed exclusively via the official WHOOP OAuth 2.0 API with explicit per-user consent. Access tokens are encrypted at rest using Fernet symmetric encryption.

3 · App Screens

All user-facing output is in Gulf Arabic. Captions describe each screen in English.

Morning Message (daily, automated)

Sent each morning. Displays: recovery score + readiness verdict, sleep duration + adequacy rating, yesterday's strain vs personal average, HRV (with explanation), resting heart rate, activity note, cumulative 3-day trend layer (vs 30-day personal baseline), and a personalised daily insight. Every data point is sourced from the WHOOP API.

Evening Check-in Summary (daily, user-initiated)

After the user completes their evening self-report (energy, focus, sleepiness, work stress, caffeine timing, last meal, workout, nap, note), the bot confirms with a full summary. Self-reported data is stored and cross-referenced with WHOOP metrics to power the personalised insight layer.

Weekly Pulse (every 7 days)

Highlights the best and hardest days of the week with WHOOP data and causal context, week-over-week comparisons (recovery average, sleep average, workout count, late-cafeine days), and a feeling-vs-body divergence note when data supports it.

30-Day Report Card (every 30 days)

The flagship output. Provides: 30-day averages for sleep, recovery, HRV, resting heart rate; age/gender demographic benchmarking; recovery trend chart across the period; behavioural observations with confidence ratings; and a month-on-month comparison from cycle 2 onward. Demonstrates the depth of WHOOP data over time.

4 · Compliance & Privacy

OAuth 2.0	Standard WHOOP OAuth flow. Each user explicitly authorises their own connection.
Token security	WHOOP access tokens are encrypted (Fernet) before storage in a managed PostgreSQL database (DigitalOcean).
No data resale	WHOOP data is used solely to generate the user's own coaching messages. No data is sold, shared, or used for advertising.
No third parties	Zero ad networks. Zero analytics SDKs. Zero data brokers.
User control	Users can request full data deletion at any time via anmatak.coach@gmail.com .
Privacy policy	https://anmatak-coach.github.io/anmatak-privacy/privacy.html
WHOOP brand	WHOOP branding is referenced only to describe the data source — not to imply endorsement or partnership.

5 · Technical Stack

Component	Technology
Bot platform	Telegram Bot API (long-polling)
Backend	Python 3
Database	PostgreSQL (DigitalOcean Managed)
Hosting	DigitalOcean Droplet — Ubuntu 24.04
WHOOOP auth	OAuth 2.0 with token refresh; per-user encrypted storage
Insight engine	Custom 4-gate pipeline: data sufficiency → signal → confidence → no-reassurance
Test coverage	425 scenario checks (all passing)

6 · Why We Are Seeking Approval

Anmatak is currently in private beta with 2 WHOOP members over 47 live days. We are seeking approval to expand beyond the 10-member development limit to onboard additional Arabic-speaking WHOOP users in Saudi Arabia.

The Arabic-speaking market is a significant underserved segment of WHOOP's global user base. There is currently no WHOOP-integrated coaching product in Arabic. Anmatak directly extends WHOOP's value to this audience — making WHOOP data actionable in their language, culture, and daily context.

We are fully committed to WHOOP's API Terms of Use, Design Guidelines, and privacy standards.
